

AI Agents that Automate.
Systems that Scale.

● 0G LABS GLOBAL HACKATHON

Verifiable yield optimization for the AI-native Web3.

Mainnet-first optimizer, anti-hallucination guardrails, 0G proof trail, frictionless judge review, Agent NFT minting, and strategy marketplace adoption.

0G Mainnet default

0G Storage + ProofRegistry

Integrity Auditor

Agent NFT + Marketplace

Live app: yieldboost-ai.vercel.app/judge

AI yield advice is easy to generate. It is hard to verify.

AI can hallucinate

Finance agents need guardrails before an output is treated as a trusted strategy.

Opaque recommendations

Most dashboards show a route, but not the wallet snapshot, proof trail, and validation context behind it.

Temporary strategy state

A completed strategy should become a portable on-chain artifact, not disappear as a UI-only result.

YieldBoost AI turns an optimization into a visible chain of custody: compressed input, runtime guardrail, 0G Storage, ProofRegistry anchor, Agent NFT, and marketplace adoption.

One click produces a strategy, a proof, and a review surface.

1

Connect wallet

User enters the normal dashboard flow with an active wallet context.

2

Optimize route

Portfolio snapshot is compressed and routed through cache, embeddings, compute, and auditor checks.

3

Anchor proof

Result is stored through 0G Storage and anchored through ProofRegistry.

4

Review or mint

Judge Mode audits the proof. User can mint and list a Strategy Agent NFT.

Projected APY

23.84%

latest proof snapshot

Confidence

96%

route scoring

Guardrail

100

Integrity Auditor score

Agent NFTs

3

mainnet minted strategies

The system is built around a verifiable data path.

The key design choice: AI output is treated as a proposal until it passes guardrails and becomes a durable, wallet-scoped proof artifact.

Audit-first UX: no wallet, no faucet, no rerun.

Hard-locked demo wallet

0x8a3c7524Aaed081825aC88eC7f4cCECFc583ee7D

Mainnet-first, testnet switchable

Reviewers can compare networks without leaving the audit page.

Direct explorer path

Latest storage tx, ProofRegistry anchor, Agent NFT mint tx, marketplace, oracle, contract addresses, and proof history are surfaced in one place.

Live contracts and latest proof trail are already on 0G mainnet.

ProofRegistry

0x8e63e117E71A80Cfc10fDF375F079e2e29cd7D7D

Anchors proof metadata and emits the reviewable proof event.

YieldStrategyINFT

0xb264D861264B0e4f8fb98A61B7694BA8a3B6BBE3

Mainnet Agent NFT contract for strategy ownership.

Attestation Oracle

0x216E7880D64D94335B583c539802d3e61958d4A2

Registers verified attestation hashes before INFT verification is marked on-chain.

Strategy Marketplace

0x48F989C7f41056509980731C1b4D59164C0C1A40

Mainnet adoption contract for listed proof-backed Strategy NFTs.

Latest ProofRegistry tx

0x2c50807ad1b35cda372f420f1a996dfa7a6555d4b7672f265fbb60d79bcd82b1

Latest tested mainnet proof anchor from the product flow.

Latest Agent NFT mint tx

0x5fa0bdd16f914941d127aaa2cefcedecccc48d9b1d7bd31f52605b5a901aaf4ff

Token #3 minted to the connected demo wallet during live validation.

Inference is optimized before the system spends compute.

Semantic Cache

Scoped by wallet, network, normalized prompt, and portfolio digest before new inference runs.

Embedding Reuse

Alibaba text-embedding-v4 can reuse similar optimization requests for the same wallet and asset signature.

Prompt Compression

The optimizer rewrites noisy input into compact intent, constraints, and portfolio facts.

Integrity Auditor

Checks AI recommendations against the real snapshot before proof writing or NFT minting.

1

Raw intent

User request + portfolio

2

Compacted prompt

Less noise, same decision context

3

Reuse check

Exact cache or vector similarity

4

Audit then store

Reject unsafe or unrealistic output

Optimization results become ownable agent artifacts.

After a proof-backed optimization, the user can mint the strategy through YieldStrategyINFT. The NFT is not the proof itself; it is the portable strategy artifact linked to the verified runtime output.

Minted to the connected wallet

Agent ownership follows the user wallet, not the server signer.

Marketplace adoption

Listed strategy NFTs can be inspected through proof metadata before adoption.

Auditor-gated mint

Rejected recommendations do not enter the proof-to-NFT path.

From verifiable optimizer to Proof-of-Optimization economy.

Phase 1: Mainnet proof product

Live proof trail, Judge Mode, Integrity Auditor, Agent NFT minting, marketplace, and dual-network review.

Phase 2: \$YA0G reward logic

Reward high-quality optimization events backed by ProofRegistry and measurable outcome metadata.

Phase 3: Mining by optimization quality

Proof-of-Optimization weights verified runs by confidence, impact, and durable proof coverage.

1

Run

User optimizes portfolio

2

Guardrail

Integrity Auditor approval

3

Verify

0G Storage + ProofRegistry

4

Own + adopt

Agent NFT marketplace

YieldBoost AI is strongest as a mainnet-live verifiable finance product: AI recommendations with a proof trail judges can inspect in seconds.
