

One click. Nine layers. Verifiable yield.

A consumer yield product on top of a security stack that can also be sold as API infrastructure.

FOR USERS

1-click

For idle assets and cautious DeFi users.

FOR BUILDERS

API store

Buy the full stack or one exact security layer.

FOR THE MARKET

Public proof

Vault and faucet surfaces make the security testable.

Crypto has idle capital, but AI recommendations still lack trust.

Users want yield without reading a maze of protocols. Developers want security modules without building a full proof stack. Protocols want fair access without bot farms.

USER PAIN

Idle balances stay idle

Most users do not know where to route capital or how to verify the recommendation after it appears.

AI PAIN

Outputs are easy to fake

A financial answer needs memory, risk checks, storage proof, and a receipt, not just confident text.

PROTOCOL PAIN

Growth invites abuse

Airdrops, API keys, partner SDKs, and vaults all need anti-sybil and proof-aware access control.

The bottleneck is trust. YieldBoost makes trust usable, sellable, and externally reviewable.

1-click optimize serves two types of crypto users.

One group wants yield without DeFi homework. The other wants proof before trusting the route.

SEGMENT 1

Lazy Degens

Users with idle coins who do not want to compare pools, routes, slippage, and DeFi steps manually. They use YieldBoost because one click turns the mess into a route.

SEGMENT 2

Paranoid Investors

Users who want yield, but only when the route has 9-layer checks and a proof receipt behind it. They use YieldBoost because the security trail is visible.

YieldBoost gives both groups a simple button with a visible security trail.

HOW IT WORKS

Connect, click, see the proof.

The user journey is three steps with one visible proof path behind them.

1 One button

Connect wallet, click optimize, receive a route, and open the proof status.

2 One receipt

OG Storage, ProofRegistry, ZK evidence, and optional Agent NFT make the result reviewable.

3 One proof path

The 9-layer stack runs behind the click: blacklist, auditor, TEE, memory, storage, ZK, registry, governance, handshake.

The 9-layer military-grade stack is the product engine.

It protects user optimization, powers paid APIs, and gives the public vault/faucet a real security model to test.

01

Hallucination Blacklist

Reject unsafe patterns.

02

Integrity Auditor

Check output before storage.

03

Secure Compute / TEE

Model execution evidence.

04

Sovereign Memory

Persist reviewable state.

05

0G Storage Proof Layer

Store proof artifacts.

06

Zero-Knowledge Proof Layer

Noir and ZK envelopes.

07

ProofRegistry Anchor

On-chain receipt path.

08

Programmable Governance

Policy and risk scoring.

09

Cross-Agent Neural Handshake

Agent-to-agent transcript.

LIVE PROOF

Mainnet evidence is visible from Judge Mode.

The demo is not just a dashboard. YieldBoost exposes CIDs, explorer links, ProofRegistry records, ZK artifacts, TEE evidence, and Strategy Agent NFTs.

PROOFREGISTRY

#36

Mainnet review record.

OG STORAGE

CID

Proof payload and memory artifacts.

AGENT NFT

#5

Verified strategy artifact.

ZK PROOF

Noir

Agent identity and ZK envelope path.

TEE

OG Compute

Model evidence when compute path is enabled.

EXPLORER

Open

External receipts, not private claims.

OG EVIDENCE

06 / 12

Modular Immunity Armory sells the security stack as API inventory.

Developers do not need to buy the whole system. They can subscribe to the complete 9-layer API, one exact layer, anti-sybil protection, or selected partner wrappers.

FREE**0 0G**

- + Non-AI modules
- + ZK proof preview
- + No TEE or partner SDK

BUILDER**88 0G**

- + Verification modules
- + Anti-sybil module
- + Governance APIs

PRO TRIAL**0.00001 0G**

- + Alibaba fingerprinting
- + ZK and proof access
- + No TEE

PROTOCOL**8888 0G**

- + Full 9-layer compute
- + TEE access
- + Partner SDK support

Consumer product creates demand. API subscriptions turn the trust layer into recurring infrastructure revenue.

Vault and faucet prove the stack outside the happy path.

The security story becomes stronger when people can attack it, farm it, and test it with real wallets.

LIVE CHALLENGE VAULT

Public target for attackers

The vault is a challenge surface: if someone can break the protection model, they prove it against a live target instead of a slide.

- + Testnet-friendly so many wallets can try
- + Attempts are visible and repeatable
- + Designed as a trust-building security demo

ANTI-SYBIL FAUCET

Airdrop defense example

The faucet shows how a crypto company could protect public claims with deterministic checks, ZK proof, and Alibaba fingerprinting.

- + Mainnet-ready protection modules
- + Commercialized inside the API store
- + Useful for campaigns, access, and onboarding

Three buyer segments, one security core.

YieldBoost sells to users first, then to developers and protocols that need the same trust layer.

DEFI USERS

Make idle balances work

Users want a simple optimizer that explains the route and leaves proof behind.

DEVELOPERS

Rent security layers

Builders can plug in ZK, proof lookup, governance, storage, or full 9-layer verification.

PROTOCOLS

Protect growth

Airdrops, vaults, and partner SDKs need anti-sybil checks and proof-aware execution.

One moat creates many revenue lines.

The same security core supports yield optimization, API subscriptions, anti-sybil access, and partner integrations.

SELECTED WRAPPER EXAMPLE

VeilSolver Secure Proxy

A partner SDK can be wrapped with selected protections such as isolated execution, ZK envelope, and 0G anchoring. This is not represented as the full 9-layer product.

WHY THIS SCALES

One moat, many products

The same security core supports yield optimization, API subscriptions, anti-sybil access, vault challenges, and future partner integrations.

Consumer product creates demand. The moat becomes recurring revenue through API, partner, and enterprise channels.

Phase 1 is live. The next phases scale distribution and trust.

Each phase builds on top of the previous one, so security and revenue compound together.

LIVE

Now

Core Fortress

- + 9-layer stack
- + 1-click optimize
- + 0G Storage + ProofRegistry
- + Native 0G API pricing
- + Vault and faucet surfaces

NEXT

Q3/Q4

Liquidity Hub

- + YieldSwap DEX
- + High-performance AI gateway
- + Autonomous optimizer agents

NEXT

2027

Enterprise Trust

- + Formal verification audit
- + ISO/IEC 42001 path
- + SOC 2 Type II path

NEXT

Beyond

Global Standard

- + Omni-chain deployment
- + Autonomous red-teaming
- + AI security marketplace standard

A trust business wrapped around a usable DeFi product.

Not a demo button. A real user product, security stack, and revenue model — all on 0G.

SIMPLE ENOUGH FOR USERS

One click creates the first proof

The user sees a route, a receipt, and a path to mint a strategy artifact.

USEFUL ENOUGH FOR DEVELOPERS

The moat is sold as APIs

Teams can buy full-stack verification, exact layers, anti-sybil protection, or selected wrappers.

VISIBLE ENOUGH FOR REVIEWERS

Receipts are external

0G Storage, ProofRegistry, ZK evidence, TEE evidence, and NFTs are exposed through Judge Mode.

HARD ENOUGH TO MATTER

Public challenge surfaces

Vault and faucet flows force the security model to face real wallets and repeated attempts.
