

TITAN PROTOCOL. A 10-layer integrity business on 0G.

YieldBoost AI is a B2B API / SDK marketplace for Web3 AI-agent trust infrastructure. The 1-click dashboard is the flagship showcase proving the stack works live on mainnet.

THE PROBLEM

Web3 AI does not just need better UX. It needs a trust infrastructure layer.

The real gap is not one more dashboard. The gap is reusable infrastructure for secure execution, proof storage, policy control, sovereign memory, and auditability.

DEVELOPER PAIN

Trust is rebuilt from scratch

Teams can build AI flows, but most cannot package secure execution, proof, and policy as reusable products.

BUYER PAIN

Security claims are hard to verify

Most products talk about trust, but do not expose an on-chain review path that enterprise buyers can inspect.

PROTOCOL PAIN

Growth invites abuse

Airdrops, API keys, partner SDKs, and protected runtimes all need anti-sybil and proof-aware access control.

The bottleneck is trust. YieldBoost packages trust as modular infrastructure.

The marketplace is the product. The dashboard is the proof.

YieldBoost should be read in one order: TITAN PROTOCOL is the engine, the API store is the business, the 1-click dashboard is the flagship showcase, and Judge Mode is the audit terminal.

PRIMARY BUSINESS

B2B modular infrastructure

Developers, protocol teams, and enterprise buyers subscribe to the 10-layer stack as APIs, SDK wrappers, and fortress modules.

FLAGSHIP PROOF

Mainnet product shell

1-click Optimize is the fastest way to prove TITAN PROTOCOL can secure a real business workflow instead of remaining backend theory.

This is not “an optimizer with extra security.” It is a security business with a live mainnet showcase.

HOW IT WORKS

How the flagship showcase proves the engine.

The dashboard is valuable because it compresses a large infrastructure story into one visible mainnet flow.

1 One shell

Connect wallet, click optimize, and watch TITAN PROTOCOL secure a real product path.

2 One receipt

OG Storage, ProofRegistry, ZK evidence, and the judge terminal make the run reviewable.

3 One engine underneath

The 10-layer TITAN PROTOCOL stack runs behind the click: blacklist, auditor, TEE, memory, storage, ZK, registry, governance, handshake, Nitro.

THE MOAT

TITAN PROTOCOL is the product engine.

It powers the marketplace, secures the flagship showcase, and gives the judge terminal a live on-chain proof story.

01

Hallucination Blacklist

Reject unsafe patterns.

02

Integrity Auditor

Check output before storage.

03

Secure Compute / TEE

Model execution evidence.

04

Sovereign Memory

Persist reviewable state.

05

0G Storage Proof Layer

Store proof artifacts.

06

Zero-Knowledge Proof Layer

Noir and ZK envelopes.

07

ProofRegistry Anchor

On-chain receipt path.

08

Programmable Governance

Policy and risk scoring.

09

Cross-Agent Neural Handshake

Agent-to-agent transcript.

SECURITY MOAT

AWS Nitro Enclaves

LIVE PROOF

Judge Mode is the live audit terminal for the marketplace.

This is how buyers and judges verify the claim. YieldBoost exposes CIDs, explorer links, ProofRegistry records, ZK artifacts, TEE evidence, and continuity signals in a read-only surface.

PROOFREGISTRY

#36

Mainnet review record.

OG STORAGE

CID

Proof payload and memory artifacts.

AGENT NFT

#5

Verified strategy artifact.

ZK PROOF

Noir

Agent identity and ZK envelope path.

TEE

OG Compute

Model evidence when compute path is enabled.

EXPLORER

Open

External receipts, not private claims.

The marketplace is the business, not an accessory page.

Developers do not need to buy the whole system at once. They can subscribe to the complete 10-layer API, one exact layer, anti-sybil protection, fortress modules, or selected partner wrappers.

FREE

0 OG

- + Non-AI modules
- + ZK proof preview
- + No TEE or partner SDK

BUILDER

88 OG

- + Verification modules
- + Anti-sybil module
- + Governance APIs

PRO TRIAL

0.00001 OG

- + Alibaba fingerprinting
- + ZK and proof access
- + No TEE

PROTOCOL

8888 OG

- + Full 10-layer compute
- + TEE + Nitro access
- + Partner SDK support

The showcase creates clarity. The marketplace creates recurring infrastructure revenue.

Public challenge surfaces prove selected modules under hostile traffic.

Vault and faucet are not the core business. They are public test environments used to stress selected protections without confusing the main B2B narrative.

LIVE CHALLENGE VAULT

Public target for attackers

The vault is a challenge surface: if someone can break the protection model, they prove it against a live target instead of a slide.

- + Testnet-friendly so many wallets can try
- + Attempts are visible and repeatable
- + Designed as a trust-building security demo

ANTI-SYBIL FAUCET

Airdrop defense example

The faucet shows how a crypto company could protect public claims with deterministic checks, ZK proof, and Alibaba fingerprinting.

- + Mainnet-ready protection modules
- + Commercialized inside the API store
- + Useful for campaigns, access, and onboarding

Three buyer segments, one integrity core.

The showcase can attract users, but the real monetization path is developer, protocol, and enterprise adoption.

DEVELOPERS

Rent the trust layer

Builders can subscribe to full-stack verification, one exact layer, or specialized protection modules.

PROTOCOLS

Protect growth surfaces

Airdrops, vaults, partner SDKs, and agent flows need anti-sybil checks, policy controls, and proof-aware execution.

ENTERPRISE TEAMS

Buy auditability

Private execution, modular controls, and visible proof trails are what make adoption budgets possible.

One moat creates many revenue lines.

The same security core supports yield optimization, API subscriptions, anti-sybil access, and partner integrations.

SELECTED WRAPPER EXAMPLE

VeilSolver Secure Proxy

A partner SDK can be wrapped with selected protections such as isolated execution, ZK envelope, and 0G anchoring. This is not represented as the full TITAN PROTOCOL product.

WHY THIS SCALES

One moat, many products

The same security core supports yield optimization, API subscriptions, anti-sybil access, vault challenges, and future partner integrations.

Consumer product creates demand. The moat becomes recurring revenue through API, partner, and enterprise channels.

ROADMAP

Phase 1 is live. The next phases scale distribution, trust, and enterprise reach.

Each phase builds on top of the previous one, so security and revenue compound together.

LIVE

Now

Core Fortress

- + 10-layer TITAN PROTOCOL
- + Flagship showcase
- + OG Storage + ProofRegistry
- + Native OG API pricing
- + Judge terminal + challenge surfaces

NEXT

Q3/Q4

Liquidity Hub

- + YieldSwap DEX
- + High-performance AI gateway
- + Reference products built on TITAN PROTOCOL

NEXT

2027

Enterprise Trust

- + Formal verification audit
- + ISO/IEC 42001 path
- + SOC 2 Type II path

NEXT

Beyond

Global Standard

- + Omni-chain deployment
- + Autonomous red-teaming
- + AI security marketplace standard

WHY YIELDBOOST WINS

A B2B infrastructure business with a live proof shell.

Not just a demo button. A real API / SDK marketplace, a live showcase, and a proof terminal — all on 0G.

SIMPLE ENOUGH TO EXPLAIN

The showcase compresses the story

The dashboard makes a large infrastructure system understandable in one click and one proof receipt.

USEFUL ENOUGH TO BUY

The moat is sold as APIs and SDKs

Teams can buy full-stack verification, exact layers, anti-sybil protection, fortress rails, or selected wrappers.

VISIBLE ENOUGH FOR REVIEWERS

Receipts are external

0G Storage, ProofRegistry, ZK evidence, TEE evidence, Nitro continuity, and NFTs are exposed through Judge Mode.

HARD ENOUGH TO MATTER

Public challenge surfaces

Vault and faucet flows force selected modules to face real wallets, hostile retries, and repeated abuse attempts.
