

YA

YIELDBOOST AI

# YieldBoost AI Protocol. TITAN X proves it live.

YieldBoost AI is a B2B infrastructure company on 0G. YieldBoost AI Protocol is the platform. TITAN X is the flagship full-stack product proving the store can become a real secure application.

PLATFORM

#### THE PROBLEM

# Most Web3 security stacks still protect only one or two layers.

One tool blocks bots. Another screens wallets. Another monitors after launch. The rest of the stack still stays exposed to hallucinations, weak proof paths, and hostile execution.

#### MARKET GAP

### Security is fragmented

AI safety, storage integrity, policy control, anti-sybil, and continuity are usually stitched from separate weak tools.

#### BUYER PAIN

### Claims are hard to verify

Most products talk about security but do not expose a live proof surface that buyers can inspect before adoption.

#### OPERATING REALITY

### Web3 is already hostile

Wallet abuse, unsafe signatures, bot pressure, and weak post-launch controls are daily conditions, not edge cases.

The bottleneck is trust. YieldBoost sells trust as modular infrastructure.

WHY NOW

# Most teams invest in security after the exploit, not before scale.

AI agents are becoming economic actors faster than Web3 trust infrastructure is maturing. The window now is to sell the missing trust layer before more products learn the lesson after loss.

BEFORE YIELDBOOST

## Teams bolt trust on later

Launch first, patch later, then explain the exploit after users, partners, and buyers have already lost confidence.

WITH YIELDBOOST

## Trust ships before growth

Execution, proof, policy, storage, anti-sybil, and continuity are packaged before the product reaches hostile traffic.

This is not another app shell with extra security. It is a security business with a live product shell.

# The store sells it. TITAN X proves it. Verification closes trust.

The dashboard is valuable because it compresses a large infrastructure story into one visible mainnet flow.

1

## The platform

YieldBoost AI Protocol is the commercial API / SDK store for modular security infrastructure.

2

## The flagship product

TITAN X is the full-stack SKU. The 1-click app is the shortest way to see it live on mainnet.

3

## The trust surface

The Verification Console exposes proof, storage, policy, and continuity receipts before a buyer commits.

FLAGSHIP PROOF

# TITAN X turns the protocol into one visible mainnet product shell.

The 1-click product MVP exists to prove the store is not selling theory. One wallet action becomes secure execution, proof storage, and a reviewable receipt.

1

## One wallet enters

The app reads a real user context instead of a synthetic demo payload.

2

## One decision gets secured

The protocol wraps the result with blacklist, auditor, storage, proof, and policy controls.

3

## One receipt leaves the flow

OG Storage, ProofRegistry, ZK artifacts, and continuity evidence make the run reviewable.

THE MOAT

# YieldBoost AI Protocol is the 10-layer product engine.

It powers the store, secures TITAN X, and gives the verification console a live on-chain proof story that point solutions cannot match.

01

## Hallucination Blacklist

Reject unsafe patterns.

02

## Integrity Auditor

Check output before storage.

03

## Secure Compute / TEE

Model execution evidence.

04

## Sovereign Memory

Persist reviewable state.

05

## OG Storage Proof Layer

Store proof artifacts.

06

## Zero-Knowledge Proof Layer

Noir and ZK envelopes.

07

## ProofRegistry Anchor

On-chain receipt path.

08

## Programmable Governance

Policy and risk scoring.

09

## Cross-Agent Neural Handshake

10

## AWS Nitro Enclaves

LIVE PROOF

# The Verification Console is the live audit terminal for the store.

This is how buyers and judges verify the claim. YieldBoost exposes CIDs, explorer links, ProofRegistry records, ZK artifacts, TEE evidence, and continuity signals in a read-only surface.

PROOFREGISTRY

#36

Mainnet review record.

OG STORAGE

CID

Proof payload and memory artifacts.

AGENT NFT

#5

Verified strategy artifact.

ZK PROOF

## BUSINESS MODEL

# The store is the business, not an accessory page.

Developers do not need to buy the whole system at once. They can subscribe to the complete 10-layer API, one exact layer, anti-sybil protection, fortress modules, or selected partner wrappers.

### FREE

**0 0G**

- + Non-AI modules
- + ZK proof preview
- + No TEE or partner SDK

### BUILDER

**88 0G**

- + Verification modules
- + Anti-sybil module
- + Governance APIs

### PRO TRIAL

**5 0G**

- + Alibaba fingerprinting
- + ZK and proof access
- + No TEE

### PROTOCOL

**8888 0G**

- + Full 10-layer compute
- + TEE + Nitro access
- + Partner SDK support

The showcase creates clarity. The store creates recurring infrastructure revenue.

## EARLY SIGNALS

# The protocol is already showing live usage and hostile traffic.

Small real numbers beat invented traction. The live surfaces already show proof-backed jobs, wallet activity, portfolio value, and public challenge pressure.

## LIVE USAGE

### 51 proof-backed jobs

The flagship product MVP has already processed proof-backed execution jobs through the live protocol path.

## OBSERVED WALLETS

### 9 unique wallets

The current public surfaces have already recorded multiple wallets across proof history and repeat testing flows.

## PUBLIC PRESSURE

### 93 blocked attempts

The vault challenge surface has already logged repeat hostile attempts against the public protection model.

## TRACKED VALUE

# Public challenge surfaces prove selected modules under hostile traffic.

Vault and faucet are not the core business. They are public test environments used to stress selected protections without confusing the main B2B narrative.

## LIVE CHALLENGE VAULT

### Public target for attackers

The vault is a challenge surface: if someone can break the protection model, they prove it against a live target instead of a slide.

- + Testnet-friendly so many wallets can try
- + Attempts are visible and repeatable
- + Designed as a trust-building security demo

## ANTI-SYBIL FAUCET

### Airdrop defense example

The faucet shows how a crypto company could protect public claims with deterministic checks, ZK proof, and Alibaba fingerprinting.

- + Mainnet-ready protection modules
- + Commercialized inside the API store
- + Useful for campaigns, access, and onboarding

Public challenge surfaces make the store story harder to dismiss

## ROADMAP

# Phase 1 is live. The next phases scale distribution, trust, and enterprise reach.

Each phase builds on top of the previous one, so security and revenue compound together.

LIVE

Now

## Core Fortress

- + 10-layer YieldBoost AI Protocol
- + Flagship showcase
- + OG Storage + ProofRegistry
- + Native OG API pricing
- + Verification console + challenge surfaces

NEXT

Q3/Q4

## Liquidity Hub

- + YieldSwap DEX
- + High-performance AI gateway
- + Reference products built on YieldBoost AI Protocol

NEXT

2027

## Enterprise Trust

- + Formal verification audit
- + ISO/IEC 42001 path
- + SOC 2 Type II path

NEXT

Beyond

## Global Standard

- + Omni-chain deployment
- + Autonomous red-teaming
- + AI security store standard

WHY YIELDBOOST WINS

# A protocol store with proof, product, and hostile-surface evidence.

Not just a demo button. A real store, a live flagship product MVP, a public proof terminal, and challenge surfaces — all on 0G.

SIMPLE ENOUGH TO EXPLAIN

## The narrative is clean

The store sells the platform. TITAN X proves it works. The verification console proves it is real.

USEFUL ENOUGH TO BUY

## The moat is sold as APIs and SDKs

Teams can buy full-stack verification, exact layers, anti-sybil protection, fortress rails, or selected wrappers.

VISIBLE ENOUGH FOR REVIEWERS

## Receipts are external

0G Storage, ProofRegistry, ZK evidence, TEE evidence, Nitro continuity, and NFTs are exposed through the Verification Console.

STRONG ENOUGH TO MATTER

## Security is multi-layer by design
